

Promoting Physical Activity among People with Disabilities in Massachusetts

Across the lifespan people with disabilities are more likely to lead a sedentary lifestyle than those without a disability. In Massachusetts, 1 out of 5 children and adults report having one or more physical or cognitive disabilities. Encouraging people with disabilities of all ages to engage in physical activity can reduce the risk or delay the onset of many secondary conditions.

Figure 1. Prevalence of inactivity by disability status for MA youth in the past week and MA adults in the past month

Some Benefits of Physical Activity:

- Reduces risk of cardiovascular disease
- Reduces risk of Type 2 Diabetes
- Improves mental health and mood
- Improves ability to do daily activities and prevent falls

Data Source: YHS 2009, MA BRFSS 2008-09

The Centers for Disease Control and Prevention (CDC) physical activity recommendations for people with disabilities:

- Follow the guidelines for their age group.
- Work with a health care provider to determine the appropriate amount and type of activity
- If it is not possible to reach the guidelines, individuals should engage in regular physical activity according to their abilities and should avoid inactivity

For all Children:	For all Adults:
<ul style="list-style-type: none"> • 60 minutes or more of physical activity each day 	<ul style="list-style-type: none"> • 2 ½ hours of moderate-intensity aerobic activity each week or 1 hour and 15 minutes of vigorous-intensity aerobic activity each week • Plus muscle-strengthening activities 2+ days a week

Disability and Obesity across the Lifespan

Obesity is a common secondary condition among people with disabilities due to the barriers related to accessing opportunities for physical activity. While overweight and obesity increase across the lifespan in both people with and without disabilities, individuals with disabilities are more likely to be obese compared with those without disabilities. For people with disabilities, obesity poses even a greater risk for chronic conditions such as diabetes and heart disease.

Community Infrastructure to Support Active Living

A number of Massachusetts communities are making strides in removing physical barriers within the built environment:

- 79% of Massachusetts communities have a comprehensive master plan which includes health and safety concerns, zoning, and land-use policies.
- 43% have master plans that address walkability.
- 34% have a policy regarding lighting on sidewalks.
